SUMMARY

Senior Site Reliability Engineer and Platform Engineer with 6+ years of experience in DevOps practices, designing and operating scalable, reliable, and observable infrastructure across cloud-native, high-traffic environments with thousands of containers/pods serving millions of users concurrently. I specialise in automation, Kubernetes, Terraform, CI/CD, and distributed systems, consistently improving platform resilience and engineering efficiency. My work includes migrating CI/CD systems to GitHub Actions and self-hosted runners, reducing costs by \$6K/month and boosting developer productivity by 83%, architecting a fully automated performance testing platform that cut execution time from 2 hours to 15 minutes and saved \$60K/year, and strengthening security, reliability, and observability across multi-cloud and large-scale service architectures. Known for eliminating operational toil, improving system performance, and building internal tools that empower teams, I bring a systems-thinking mindset and strong cross-team collaboration. I act as an owner of the platform, partnering with product and engineering to define success metrics, prioritise improvements based on customer and business impact, and iterate on solutions over time.

WORK EXPERIENCE

Quipper | Senior Site Reliability Engineer September 2022 - Present

Indonesia (Remote)

An educational technology platform providing interactive learning experiences for students and educators

- **Architected an automated distributed performance testing platform**, reducing test duration from 3 hours → 15 minutes and saving ~\$60,000/year in operational costs, done using the Terraform and Python-based automation for AWS provisioning and deployments for fast, repeatable delivery of cloud services to QA and Developers.
- **Owned and led large-scale CI/CD migration** from CircleCI to GitHub Actions with self-hosted runners, from requirements gathering to rollout and continuous optimisation, cutting costs by \$6,000/month and improving developer productivity by 83%.
- **Strengthened platform resilience** by migrating public traffic to AWS CloudFront + WAF, significantly improving DDoS protection and availability.
- **Identified documentation bottlenecks and built an AI-powered documentation copilot (GPT-4 + Azure)** as an internal product, reducing internal support load and improving developer autonomy.
- **Implemented Terraform-driven automation and GitHub Actions workflows** to eliminate toil, including automatic cluster shutdowns for continuous cost optimisation.
- **Drove a 'platform as a product' approach**, gathered feedback from 5+ engineering teams, prioritised CI/CD and tooling features based on impact, and iterated on the platform to continuously improve deployment speed and reliability.
- **Partnered with engineering and product teams to define observability and reliability goals**, then delivered platform changes that improved resource efficiency, deployment reliability, and troubleshooting workflows.
- Supported high-traffic, consumer-facing education platforms backed by Kubernetes clusters **running thousands of pods and serving millions of users**, where latency and availability directly impacted the business.

eFishery | DevOps Engineer June 2021 - September 2022

Indonesia (Remote)

Aquaculture technology startup providing smart farming solutions for fish and shrimp farmers

- **Operated a large-scale Nomad environment** with 30+ nodes and 700+ containers powering core aquaculture products, ensuring high reliability, efficient resource utilisation, and smooth operation under high load.
- **Built and maintained internal CI/CD tooling** in Go, improving delivery workflows and developer productivity across teams.
- **Migrated secret management from Bitbucket to HashiCorp Vault**, strengthening security and integrating seamlessly into CI/CD pipelines.
- **Designed centralised logging and monitoring using Elastic Stack**, handling 40+ applications and 4B+ logs/day to improve visibility for engineering, business, and security.
- **Researched and delivered platform improvements**, including ZTNA security models and optimised architecture for Odoo migration.

Halofina | System Engineer October 2019 - February 2021

Bandung, Indonesia

Fintech startup offering goal-based robo-advisory and financial planning services for consumers and enterprises

- **Ensured availability and security of production systems** through proactive monitoring, performance tuning, and automated remediation.
- **Built automation scripts to reduce manual operational** overhead and shorten incident resolution times.
- **Diagnosed and resolved bottlenecks** by collaborating with developers, improving system performance and stability.

Halofina | Backend Engineer March 2019 - October 2019

Bandung, Indonesia

Fintech startup offering goal-based robo-advisory and financial planning services for consumers and enterprises

- **Developed secure APIs** in Java and PHP; migrated key API stacks from PHP to Java using Vert.x for improved performance and maintainability.
- **Built reusable libraries, documentation, and test suites** to accelerate backend development.

Sirus+ | Backend Engineer August 2018 - March 2019

Bandung, Indonesia

A company focusing on solving problems in the Healthcare Industry

- **Built modular, scalable Node.js/TypeScript APIs** supporting REST & GraphQL, enabling future microservice adoption.
- **Implemented unit and E2E testing, CI/CD deployment, and performance improvements** for healthcare systems.

Lussa | Backend Engineer

Bandung, Indonesia

August 2017 - August 2018

A company utilising advanced technology to solve various problems

- **Developed secure backend APIs** for healthcare products, ensuring high performance and reliability under production workloads.
- **Delivered CI/CD-driven deployments** to accelerate release cycles.

SKILLS

Cloud Platforms: AWS, GCP, Azure
Programming Languages & Runtimes: Go, Python, Java, JavaScript/TypeScript, PHP, Bash
Backend & API Frameworks: Node.js, Express, Vert.x, GraphQL, Flight Micro-Framework
Databases & Messaging: PostgreSQL, MySQL, MongoDB, Galera Cluster, RabbitMQ, Kafka
Infrastructure, IaC & Secrets: Terraform, Ansible, Chef, HashiCorp Vault, HashiCorp Consul
Containerization & Orchestration: Docker, Kubernetes, Nomad
CI/CD & Platform Tooling: GitHub, GitHub Actions, GitLab, GitLab CI/CD, Bitbucket, Bitbucket Pipelines, CircleCI, Jenkins, Argo CD
Observability & Monitoring: Elastic Stack, OpenSearch, Prometheus, Grafana, Datadog, Sentry, CloudWatch
Networking, Edge & Access: NGINX, OpenVPN, Printunl Zero
Testing: Postman, Cypress
Core Competencies: Site Reliability Engineering, Platform Engineering, DevOps, Cloud Architecture, Infrastructure as Code, CI/CD Automation, Kubernetes, Terraform, Cost Optimisation, Incident Management, Observability, Performance Testing, Developer Experience

SELECTED PROJECTS

- Distributed Automated Testing Solution - Quipper

December 2024 - June 2025
- Architected and implemented a distributed testing infrastructure that reduced QA test execution time from 3 hours to 15 minutes per scenario (95% reduction). Delivered \$60,000 in annual cost savings while significantly reducing operational overhead and manual testing effort across teams.
Read the story: <https://defa-ekky1073.github.io/entry/performance-test-improvement/>
- CI/CD Migration & Automation - Quipper

September 2022 - March 2023
- Migrated CI/CD from CircleCI to GitHub Actions with self-hosted runners, saving \$6k/month. Created custom actions and workflows that boosted developer productivity by 83% through data-driven optimisation of deployment frequency and integration times.
- Centralised Logging & Monitoring - eFishery

February 2022 - August 2022
- Researched, designed, and implemented centralised logging and monitoring using ElasticStack, serving 40+ applications, ingesting 4 billion logs daily. Provided critical insights for engineering, business, and security teams across various stacks, systems, and platforms.
- Infrastructure Management - eFishery

June 2021 - September 2022
- Managed and maintained infrastructure using Hashicorp Nomad as orchestrator, consisting of 30+ nodes and 700+ containers, supporting production traffic for nationwide aquaculture operations. Developed custom CI/CD tools and developer tooling using Go to improve deployment and development experience.

EDUCATION

- Computer Engineer Degree (Bachelor of Science equivalent)

October 2012 - December 2016
- Brawijaya University, Malang - Indonesia
